

I am really sorry to say this but I am writing this report after writing the complete code instead of while writing code. So might not be that brief about each every line. I will not repeat it again.

The goal of the project was to create a simple, functional calculator using HTML, CSS, and JavaScript.

1. HTML

To link this with css code I added a line inside the head part.

Then inside the body I 3 div options one for calculator part ,other is display one and the last one is buttons .

By using button and onclick made to display the digits while for operators I used button operator .But for equal it should not display = ,so made onclick to operate. Where as for AC and DEL button on onclick made to clear display and delete last option.

2. CSS

In this part I just decorated the screen and made it look good by trialing many times.

Firstly I gave whole body a colour and sans-serif font family and alligned everything in the center.

To get equal space and to make grid I used “.” ,and gave size accordingly to every part. I gave many trials about colours ,choosing that only took me around 1 hour but at last I satisfied with my output.

3. JavaScript

For the functions I mentioned in the html code part I written their respective codes. Writing the code for display,clear and delete part easy some what similar to c++ I learnt in 1st sem ,but to write code for calculate I searched in youtube and modified it slightly.

Thankyou :)
